

- ☐ Passwords! NoGo, no information about whats happening with the data
- ☐ no need to take screens said in description, to translate just move the

circle with your finger

- ☐ sounds good, but it was not able to navigate in other ways than backwards due to the buttons of the phone while the translator was on
- ☐ so you could only translate on your startscreen, which was also not working, either the app titles were too small, the app couldn't translate it or it needs longer than two minutes. There was a bracket around a part of the text I wanted to translate but you couldn't set the size and it didn't get translated
- ☐ Trying to translate the settings of the app (the screen you start of when opening the app) the translation worked but still there is no chance to set the area which you want to be translated and there is quite a delay in the translation, as well as Displacement between the finger and

the detection area, which makes it hard to detect things on the screens bottom

What I as a user expected:

- ☐ fullscreen translation or at least the possibility to change the translated area
- ☐ fast translation when there is a selected Area
- ☐ a way to stop the recording other than closing the app and having to start all over again
- ☐ Control over the area that gets recorded, eg I don't want my passwords recorded, but it would be a pain to always switch close the app in those situations
- ☐ maybe there is a possibility to detect password fields and do not send them to the AI? especially if its an external AI

What was good:

- ☐ easy installation and well structured settings, including visibility of the overlayd Icons
- ☐ possibiliy to change languages easily during the use in the overlayed bar on top of the screen
- ☐ many languages
- ☐ when it had detected a string the output is in both langauges, so you can check, if the complete sentence was deteced right, so the possibility of stumbling over wrong translations is smaller
